

## Unit Test Delete Task

Done by Weikai Wu

### Objective:

Verify that when a user deletes a task, it's also correctly deleted in database.

### Setup:

1. Go to admin page <https://wwu39.pythonanywhere.com/admin> (require admin password), under **Installed applications** list, click manage **prostudy**, and then click Edit. Click on database administration and select db.task. Initially it's empty.
2. Now click "NEW RECORD" to create new tasks in the database, can be done manually or by scripts. There should be 4-5 usernames and each has 3-4 tasks. Record all the usernames.
3. Go to the product <https://wwu39.pythonanywhere.com/prostudy> (SUT) and turn web inspector on.

### Exercise & Verify:

1. Login with recorded usernames respectively, delete a task, and then verify the deleted task is deleted in the database. Repeat until all tasks are deleted.
2. Web inspector never reports an error.

### Tear-down:

1. ~~Clear database table db.task (done via admin page).~~ Already empty after testing.
2. Delete all accounts for testing (done via admin page).
